Submit Your Site To Search Engines and Win Big

When it comes to making websites more relevant, it's imperative to get into the search engines. The average webmaster might not know how to seriously get your site in the face of consumers, and in case you run into someone like that or you are going the DIY route, you will want to learn how to submit to Bing and others. There are several methods that you can follow, but most importantly, it's crucial to make sure that your website is first ready for presentation. If you feel that your website is ready for its grand premier, than you will be able to submit and get accepted within a few short hours and in some instances immediately.

The first method is simple, you need to go to Bing and then look for the area that you can submit your website to. You can even search with the keywords you're looking for and then proceed from there. The site allows submissions,

but it's hard to figure out what kind of algorithm they are using to list their websites in relevancy and beyond. This method is the direct option, but with so many websites being pushed into the internet's search results, you might find that it will take some time to get listed.

The second thing that you can do is find a submission service that works with a variety of different companies to push your website through to the listing. These companies ping and submit your url to all the major websites out there and make sure that you're listed. This service is usually a one-time deal, and does not require multiple shots.

The one thing that you need to remember is that most of the search engines will come to you. Unfortunately, many people don't believe that, but Bing and others are fast with listings, if you have your website up to date with the right code. If you're coding in xhtml or html 5, you are most likely going to get listed swiftly after you launch. The only reason why you want to add submissions is because you are not getting the attention of the search engines.

There are several reasons why you might not be getting listed, and one of them could be you're not putting together easy to read code in the backend. In order for the engines to pick up on any given website, it is imperative that the code is done properly, and is not full of errors or runaway objects. If you or someone you know is coding the website and it doesn't follow the proper protocol, you will see diminished listings or omissions altogether.

When in doubt, submit directly to Bing and wait for them to respond. The best approach is the direct one, and when that fails, go for a submissions service that will help you. If that fails as well, then you will need to look at your code and make sure that you're currently in line with the standards of the most recent coding updates. Without proper code structure, you can't expect to get into any search engine, unless it's a fluke.

The Top 10 Search Engines

When it comes to the online world chaos abounds. There are millions of websites out there and to figure out what each one does or how they relate to just about anything, can be quite difficult to manage. Think about what would happen if you needed something and couldn't find it. For instance, what if you were in need of a new bicycle and wanted to find a store online that specializes in bikes, but couldn't find anything. Where would you go? If you said search engines, you're right. Without search engines there is no connectivity within the infrastructure of the web, which is why they are important in these modern times.

Finding which engine is best can be daunting, especially since there are so many out there, but the following will try to compile the top 10 search engines that you can utilize online, whether to find something or to submit your website for ultimate SEO and listings.

10. **Duck Duck Go** - At the number 10 spot here is the simple web engine that could. It is a site that is simple to use, and gives you simplistic results when you need them. This is not the definitive option that you'll want to utilize in your quest, but it is one that many find to be far easier to utilize than some of the bigger ones on our list.

9. **Dogpile** - Dogpile came out with an interesting option, search all the engines at once. They still manage to give you results from all engines at once, but it's a far cry from what it was long ago.

8. **Ask** - Ask is one of the better sites to utilize as it has more than just results, it has a full portal of questions and answers that will give you information on just about any topic that you can think of.

7. **The Internet Archive** - This engine is one of the more powerful ones that can dig up the past. If you have an online presence or miss a website of any type, this site will find it and showcase it to you. It also has lots of information, videos, audio and beyond.

6. **Yippy** - So you want more web search but less filler? Here you go, Yippy has a lot of pages that you might find elsewhere, but easy to use features make this one a bit more special. It has some serious obscure references in their search and it doesn't filter things quite as much as the big 4.

5. **Mahalo** - The concept with this site was simple, let's have everyone else do the listings for us, and not let spiders do their job. Well, here you have a human powered search engine, and much like Wikipedia, it works quite well. It can get things wrong sometimes, but hey, we are all human and errors are expected.

4. **Lycos** - The mighty Lycos is still around and with a whole new contemporary design. The site that used to act more like a portal of cool is now very much looking like Bing in many ways, but many users still utilize is, so it hangs in there as one of the more popular options.

3. **Yahoo** - One of the longest running search websites in the world is still at it today. They are not #1 in any way, but they still manage to get serious amounts of traffic, and it could be due in large part to the age of their domain name and popularity throughout the years.

2. **Bing** - Microsoft wanted to get their hands on a better way to search, so they came out with this monster to compete with Google. It works great, has intuitive links and is the #2 option in the world.

1. **Google** - The biggest and baddest is also the most popular and well-received search engine in the world. There is no way to topple this giant, and if you are a Webmaster, you have better get in good with this engine.

The aforementioned are the top 10 search engines in the world, and they bring the Internet to an easy to digest place to dwell, work, and even play.
